Milestone #: ___2_____

Date: ___2023.10.19_____

Group Number: _____92_____

| Name	Student Number	CS Alias (Userid)	Preferred E-mail Address
Jialu Jin	24403594	a2f3b	xyxxjinjialu@163.com
Camilla Ren	93534105	d5k5m	camillarr1002@gmail.com
Hao Jiang	58301110	o3f3l	a1181445408@126.com

By typing our names and student numbers in the above table, we certify that the work in the attached assignment was performed solely by those whose names and student IDs are included above. (In the case of Project Milestone 0, the main purpose of this page is for you to let us know your e-mail address, and then let us assign you to a TA for your project supervisor.)

In addition, we indicate that we are fully aware of the rules and consequences of plagiarism, as set forth by the Department of Computer Science and the University of British Columbia

2. A brief summary of your project.

Our project is centered around a comprehensive fitness and wellness management application. This application serves as a collaborative tool for gym members and trainers, allowing them to track, manage, and coordinate various aspects of a member's health journey. Key functionalities include storing member profiles, workout histories, and body measurements, enabling trainers to offer personalized advice and schedules, and ensuring gym equipment and space efficiency through detailed room and equipment management.

3. The ER diagram you are basing your item #3 (below) on.
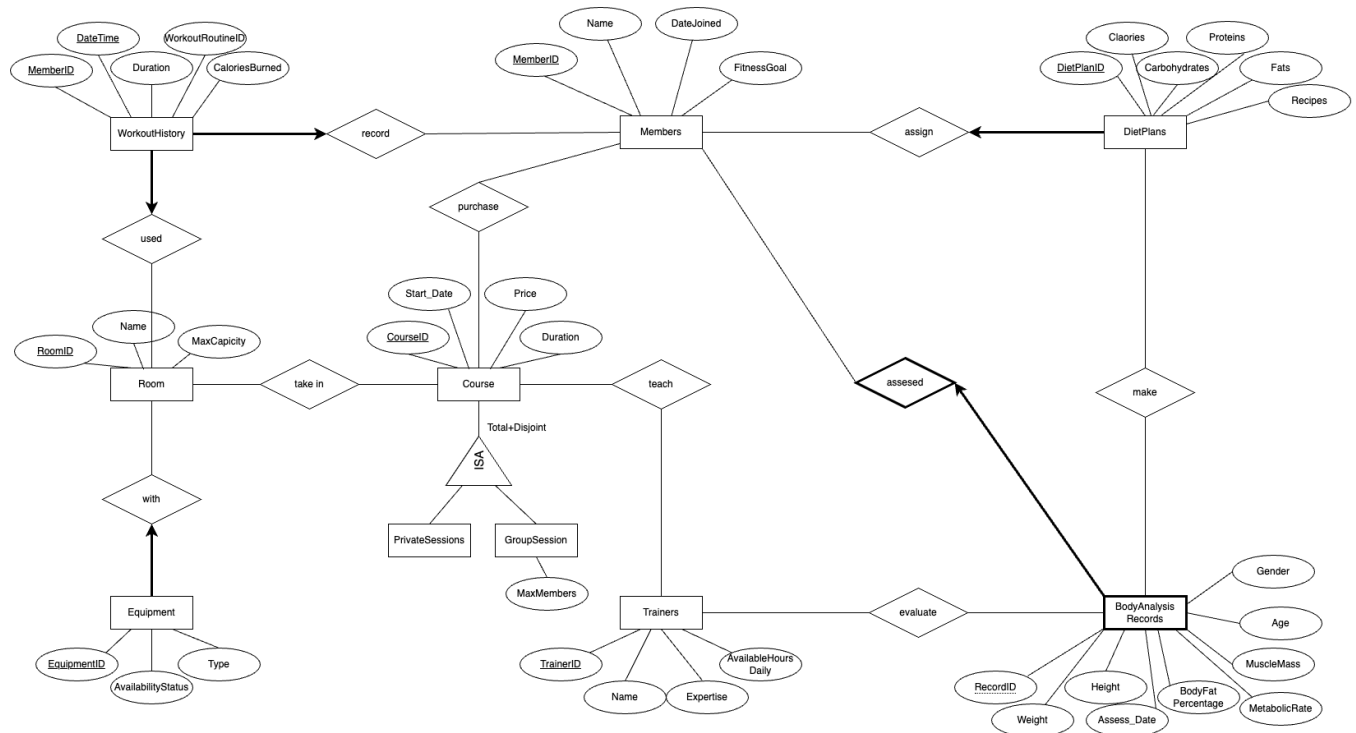

As TA suggested, we delete the redundant MemberID and change it to HistoryID as part of the PK of "WorkoutHistory", so we won't have duplicate info. We add missing Total (assuming every course must be classified as either private or group) and Disjoint (since a course being both private and group at the same time isn't logical in most scenarios) constraints to the ISA relationship. We rename the partial key of "BodyAnalysisRecord", MemName to RecordID so it is not the duplicate of the PK of the master entity ("Member") and makes more sense.

In addition, we have removed the Duration key in the "DietPlan" as it is meaningless. We also rename the WorkoutRoutineID to ExerciseID in this entity so it is more reasonable and it makes more sense. We added new keys Gender and Age to the "BodyAnalysisRecord " entity so it contains more information in helping the body analysis, which is more reasonable and makes more sense. In the "Member" entity, we delete the keys Age and CurrentRountine because we have already used them in other entities and it is redundant. We change the relationship between the WorkoutHistory and Room from one-to-one into many-to-one since we can have histories of duplicated rooms used. Also, the equipment must be contained in rooms.

4. The schema derived from your ER diagram.

WorkoutHistory(HistoryID: integer, DateTime: TIMESTAMP, Duration: integer, CaloriesBurned: integer, ExerciseID: integer, **MemberID**: integer, **RoomID**: integer)
- PK: HistoryID
- CK: HistoryID
- FK: **MemberID** REFERENCES Member, **RoomID** REFERENCES Room

- FK: **TrainerID** REFERENCES Trainer, **RoomID** REFERENCES Room
- Constraints: **CourseID**, **RoomID** are NOT NULL

5. Functional Dependencies (FDs)

      a. Identify the functional dependencies in your relations, including the ones involving all candidate keys (including the primary key).

      PKs and CKs are considered functional dependencies and should be included in the list of FDs. You do not need to include trivial FDs such as A → A.

      Note: In your list of FDs, there must be some kind of valid FD other than those identified by a PK or CK. If you observe that no relations have FDs other than the PK and CK(s), then you will have to intentionally add some (meaningful) attributes to show valid FDs. We want you to get a good normalization exercise. Your design must go through a normalization process.

WorkoutHistory:
HistoryID -> DateTime, Duration, ExerciseID, CaloriesBurned, MemberID, RoomID
Duration, ExerciseID -> CaloriesBurned

Room:
RoomID -> Name, MaxCapacity

Equipment:
EquipmentID -> AvailabilityStatus, Type, RoomID

Course:
CourseID -> Start_Date, Price, Duration

PrivateSessions:
CourseID -> Start_Date, Price, Duration

GroupSession:
CourseID -> Start_Date, Price, Duration, MaxMembers

Member:
MemberID -> Name, DateJoined, FitnessGoal

Trainer:
TrainerID -> Name, Expertise, AvailableHours Daily

DietPlan:
DietPlanID -> Calories, Carbohydrates, Proteins, Fats, Recipes, MemberID

Carbohydrates, Proteins, Fats -> CaloriesMemberID-> DietPlanID, Calories, Carbohydrates, Proteins, Fats, Recipes, MemberID
Recipes -> Carbohydrates, Proteins, Fats, Calories

assessed_BodyAnalysisRecord:
MemberID, RecordID -> Weight, Height, Assess_Date, BodyFatPercentage, MetabolicRate, MuscleMass, Age, Gender
Weight, Height, Age -> MetabolicRate
Weight, Height, Age, Gender -> BodyFatPercentage

6. Normalization

a. Normalize each of your tables to be in 3NF or BCNF. Give the list of tables, their primary keys, their candidate keys, and their foreign keys after normalization.

You should show the steps taken for the decomposition. Should there be errors, and no work is shown, no partial credit can be awarded without steps shown. The format should be the same as Step 3, with tables listed similarly to Table 1 1(attr1:domain1, attr2:domain2, ...). ALL Tables must be listed, not only the ones post-normalization.

We will check and normalize tables to be in BCNF.

7. The SQL DDL statements required to create all the tables from item #6.

The statements should use the appropriate foreign keys, primary keys, UNIQUE constraints, etc. Unless you know that you will always have exactly x characters for a given character, it is better to use the VARCHAR data type as opposed to a CHAR(Y). For example, UBC courses always use four characters to represent which department offers a course. In that case, you will want to use CHAR(4) for the department attribute in your SQL DDL statement. If you are trying to represent the name of a UBC course, you will want to use VARCHAR as the number of characters in a course name can vary greatly.

```sql
CREATE TABLE WorkoutHistory2(
    ExerciseID INTEGER NOT NULL,
    Duration INTEGER NOT NULL,
    CaloriesBurned INTEGER,
    PRIMARY KEY (ExerciseID, Duration));

CREATE TABLE Room(
    RoomID INTEGER PRIMARY KEY,
    Name VARCHAR(20) NOT NULL,
    MaxCapacity INTEGER NOT NULL);
```

```sql
CREATE TABLE Member(
    MemberID INTEGER PRIMARY KEY,
    Name VARCHAR(30) NOT NULL,
    DateJoined DATE NOT NULL,
    FitnessGoal VARCHAR(30));

CREATE TABLE WorkoutHistory1(
    HistoryID INTEGER PRIMARY KEY NOT NULL,
    DateTime TIMESTAMP NOT NULL,
    ExerciseID INTEGER,
    Duration INTEGER,
    RoomID INTEGER,
    MemberID INTEGER,
    FOREIGN KEY (ExerciseID, Duration) REFERENCES
        WorkoutHistory2(ExerciseID, Duration),
    FOREIGN KEY (RoomID) REFERENCES
        Room(RoomID),
    FOREIGN KEY (MemberID) REFERENCES
        Member(MemberID));

CREATE TABLE Equipment(
    EquipmentID INTEGER PRIMARY KEY,
    AvailabilityStatus VARCHAR(10) NOT NULL,
    Type VARCHAR(20) NOT NULL,
    RoomID INTEGER,
    FOREIGN KEY (RoomID) REFERENCES
        Room(RoomID)
        ON DELETE SET NULL);
```

```sql
CREATE TABLE Course(
    CourseID INTEGER PRIMARY KEY,
    Start_Date_Date DATE NOT NULL,
    Price FLOAT NOT NULL,
    Duration INTEGER NOT NULL);

        Course(CourseID)
        ON DELETE CASCADE,
    FOREIGN KEY (RoomID) REFERENCES
        Room(RoomID));
```

8. INSERT statements to populate each table with at least 5 tuples.

You will likely want to have more than 5 tuples so that you can have meaningful queries later.

Note: Be consistent with the names used in your ER diagram, schema, and FDs. Make a note if the name has been intentionally changed.

Note: As you start analyzing these requirements, you may notice that certain details are missing. In this case, you may make any reasonable assumptions about them; but, if there is any uncertainty about some requirements, you should ask your project TA before proceeding

further (or if it's more general in nature, post your question on Piazza). Furthermore, it is acceptable to modify your design from your original project proposal, because as you progress and start thinking more about the data and the queries that you want to answer from your application, it is normal to find that you need to modify the design (but don't go back and re-do or re-submit your project proposal).

WARNING: Do not start on the implementation portion of the project until you complete tutorial 6 /7/8. Tutorial 6/7/8 will offer a chance for you to try Oracle/Java, Oracle/PHP, and Oracle/Javascript. It is likely that you will not know what you enjoy working with until you finish these tutorials.
Check the milestone 2 assignment on Canvas for the grading rubric. Refer to the syllabus for information on late submission/penalty rules.

```
